Footer Bar

1. In - Sets plugin input gain (-24dB to + 12dB).
2. Out - Sets plugin output gain (-12dB to + 6dB).
3. Riff Recorder (Standalone only) Press to start or stop recording your riffs. Alternatively, use the keyboard shortcut « r ».
4. Riff Folder (Standalone only) Open your riff ideas folder. The recording location can be set in the global preferences menu.
5. Metronome (Standalone only)
Practice timing, and stay sharp with your guitar-playing skills.
6. Tuner - Opens the tuner window.
7. Cab - Opens the cabinet selection window. See the next page for details.
8. Settings - Opens the settings panel.

Cab options

Matched Cab - A speaker cabinet perfectly matched to the amplifier, mic'd and engineered by producer Jens Bogren.

Load IR - Clicking on this option will open your system file picker. Select an IR file you want to load. The name and root folder for the currently loaded IR will displayed.

The arrow buttons on each side of the IR name can be used to easily navigate through any other IRs found in the same folder. Hovering on the folder name will open an expanded menu for selecting other IRs from the same folder.

No Cab - Disable the built-in speaker cabinet emulation. This will also deactivate IRDX.

Metronome

The standalone version has a built-in metronome for simple and easy practice.

- 1. BPM VALUE** - Set the metronome speed. You can change the speed by double clicking the number and typing in a new value, or dragging the number up or down.
- 2. PLAY/STOP** - Starts and stops the metronome. You can also start and stop the metronome directly from the main window by right-clicking the metronome icon.
- 3. TAP TEMPO** - Tap here or tap the « t » key to set the desired tempo.
- 4. TEMPO AND SLIDER BUTTONS** - Move the slider left/right or press the « - » or « + » buttons to adjust the tempo. Press the « - » or « + » keyboard keys to make adjustments by 10 bpm or CTRL (Windows) or CMD (Mac) together with the « - » or « + » keys to make bpm adjustments.

Metronome

5. **BEATS** - Set the number of beats per bar. The most common setting is 4.

6. **BEATS AND ACCENTS** - Every beat is represented by a circle. Click any of the circles to turn that beat into an accent to create complex rhythm patterns.

7. **NOTE VALUE** - Choose the desired value for the note played: quarter, eighth, sixteenth, or triplets.

8. **SPEED TRAINER** - Automatically increase the tempo of the metronome over time to gradually increase practice difficulty without taking your hands off of the guitar.

9. **METRONOME SOUND** - Choose one of the 3 different metronome sounds.

10. **VOLUME** - Click to open the volume slider and adjust the volume of the metronome.

IO Settings menu

Available in Standalone only

Feedback Protection

By default, the input is muted to avoid unwanted feedback. Once you set up your input and output, it is safe to turn off the mute option.

Input: Select the input device.

Output: Select the output device.

Input Channels

Select the appropriate input channel(s) for your selected audio device. In most cases, you will want to select only one channel. Press CMD (Mac) or CTRL (Windows) + click to select two input channels, if needed.

Output Channels

Select the appropriate output channels for your selected audio device. For typical use, it is recommended to select two channels for output.

Sample Rate

Select the preferred sample rate. Higher values require more processing power.

IO Settings menu

Audio Buffer Size

Select the preferred audio buffer size. Lower values reduce latency (lag) when playing guitar, but increase the CPU load on your computer. This can sometimes introduce clicks and pops, and so it is recommended to set the audio buffer size to the minimum setting before introducing audible artifacts.

Test

Plays a sine sound to test your output setup. If you don't hear the sound, check your output settings.

Settings

Audio

DSP Quality

Choose between the default - "High" - and a more CPU-efficient setting - "Normal (low CPU)" - in situations where your computer is struggling to run the plugin smoothly. The plugin will always default to "High" DSP quality when bouncing, to ensure maximum audio quality.

Preferences

Show Values

Show or hide the pop ups displaying the value of the parameters you are adjusting.

Input Mode

Choose between mono or stereo modes. This option is available when two inputs are selected. Stereo should only be used when left and right inputs are different.

Gate

Gate

Turn the built in gate on to eliminate any noise or hum your guitar might be generating. The gate can also be turned off, if necessary.

Gate Threshold

Adjust the sensitivity of the gate. Move the slider to the left to make the gate less sensitive and to the right to make the gate more sensitive.

Recording

Format

Save your riffs as WAV or OGG files. (OGG is a compressed file format. The files can be opened in most major DAWs, and audio players, such as VLC).

Save to

Select where to save your recorded ideas on your computer.
